PROJECT

LinkedIn Content Intelligence Agent

A tool that researches a topic, writes a LinkedIn post in plain words, checks the facts, and waits for a person to approve it. Then it learns from the results.

Built by Lakshay Sharma
When Sep to Oct 2026
Built with Claude Code
Status Working prototype

THE PROBLEM

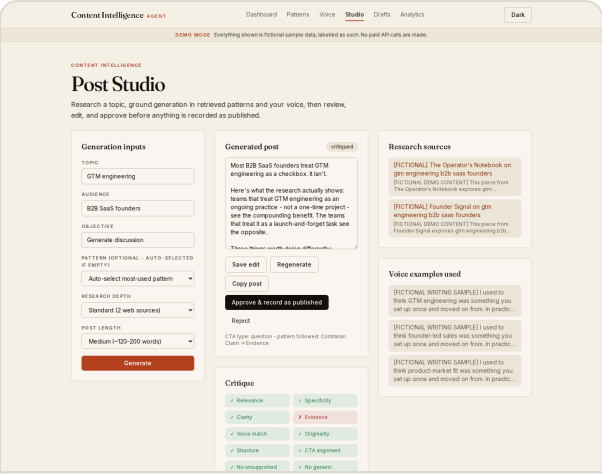

Most AI post tools turn one request into one post. They do not show where the facts came from, they do not check the numbers, and they forget what worked last time. For sales and marketing people, a generic post or a wrong number costs trust.

WHAT IT DOES

1. **Learns from real posts.** It studied public posts from 10 sales and marketing creators and turned them into 8 reusable writing patterns.
2. **Researches the topic.** It searches the web and recent Hacker News threads and keeps the real source links.
3. **Writes in plain words.** It follows simple writing rules and a saved voice profile.
4. **Checks the draft.** It flags copied text, cliches, and any number that is not in the research.
5. **A person decides.** You edit, approve or reject. Nothing posts by itself.
6. **Learns from results.** You type in how each post did. After 3 posts per pattern, it picks patterns by what worked.

WHAT MAKES IT DIFFERENT

- The AI model is one swappable part. If the first model fails, a backup model takes over.
- Every number in a draft must trace back to a source, or it gets flagged.
- Results are typed in by hand and never estimated. The tool never invents metrics.

The Post Studio: the draft, its research sources and the named checks. Demo mode, shown with sample data.

10
creators studied

8
writing patterns found

96
automated tests, all passing

11
database tables

BUILT WITH

Next.js · TypeScript · Supabase · Trigger.dev · Zod · Vitest · Vercel · GitHub Actions · Modal · NVIDIA

WHAT WENT WRONG AND WHAT I LEARNED

- Slow AI models timed out on the web host, so I moved writing into background jobs.
- A memory crash came from my own copy-check code. I rewrote it, and it now handles a 60,000 word page in under a second.
- Model replies came back in the wrong shape, so I added strict checks and one automatic retry.
- Clicking through every screen in a real browser found a bug the unit tests missed.

HONEST STATUS

- A working prototype. The demo runs on sample data, and anyone can run their own copy with their own keys.
- No real posting results recorded yet, so I make no claims about reach.
- Finding patterns in new posts is still done by hand.
- Built and used by one person so far.
